

C3
a negative plate including a negative collector comprising a copper foil free of holes, and a negative active material layer on at least one surface of the negative collector; and

a separator located between the positive and negative plates, insulating the positive and negative plates from each other.

C2
4. (Thrice Amended) The lithium polymer battery of claim 1, wherein the positive and negative active material layers are coatings of positive and negative active material slurries, respectively, on at least one surface of the positive collector and at least one surface of the negative collector, respectively.

C1
7. (Amended) A lithium polymer battery comprising:
a positive plate including a positive collector comprising a metal having a plurality of openings and a positive active material layer on at least one surface of the positive collector;
a negative plate including a negative collector consisting of a copper foil free of holes, and a negative active material layer on at least one surface of the negative collector; and
a separator located between the positive and negative plates, insulating the positive and negative plates from each other.

C4
13. (Amended) A lithium polymer battery comprising a plurality of bi-cells stacked on each other, wherein each bi-cell comprises
a positive plate including a positive collector comprising a metal having a plurality of openings, a positive active material layer on both surfaces of the positive collector, and a positive tap electrically connected to the positive collector;
a negative plate including a negative collector comprising a copper foil free of holes, a negative active material layer on both surfaces of the negative collector, and a negative tap electrically connected to the negative collector; and

CS a separator located between the positive and negative plates, insulating the positive and negative plates from each other, wherein the positive taps of the bi-cells are connected together as a first terminal of the battery and the negative taps of the bi-cells are connected together as a second terminal of the battery.

CS 15. (Amended) A lithium polymer battery comprising a plurality of bi-cells stacked on each other wherein each bi-cell comprises

a positive plate including a positive collector comprising a metal having a plurality of openings, a positive active material layer on both surfaces of the positive collector, and a positive tap electrically connected to the positive collector;

CS a negative plate including a negative collector consisting of a copper foil free of holes, a negative active material layer on both surfaces of the negative collector, and a negative tap electrically connected to the negative collector; and

a separator located between the positive and negative plates, insulating the positive and negative plates from each other, wherein the positive taps of the bi-cells are connected together as a first terminal of the battery and the negative taps of the bi-cells are connected together as a second terminal of the battery.
